Summer Fruits Harvest

Mango, Cherry, Grapes, Almonds, Nectarine, and Apple

The Israeli company FFRobotics and Abundant Robotics are two of the companies in the race to market a robot in the next few years to replace people in fruit harvesting - a system that could eventually revolutionize the industry. Harvest Machines Robots are not tired of work and are able to work around the clock. "Human picking workers are becoming a rare phenomenon," said co-founder of FF-Robotix, Gad Kober.

After harvest, agricultural produce is transported to processing centers where it is treated, sorted and packed, and then transferred to cold storage facilities or sent to wholesale markets. Adequate application of required and recommended post-harvest treatments minimizes post-harvest losses, maximizes producer profits, and results in better appearing, more nutritious fruits on consumer plates. Pomegranates and Olives Agrotechnology Tour: September 10-15, 2017

Dairy Farming in Israel for KCC Kenya

Dairy farmers from Kenya were exposed to advanced Dairy technologies in Israel on June 2017. This is the 3rd year Agrotrip Israel is organizing this tour for KCC Kenya, together with Ms. Sumbeiywo Jacqueline Jelagat and Platinum Travels.

Agriculture R&D Activity in Israel

The issue of using cannabis for medicinal purposes is relatively young in Israel and abroad and its legal status is still controversial. Cannabis cultivation for medicinal use must be carried out in accordance with strict and appropriate agricultural quality requirements suitable for medicinal use.

The Ministry of Agriculture in Israel sponsors 6 R&D studies to improve the growth of medical cannabis: development of optimal irrigation and fertigation technologies, intelligent treatment of diseases and pests, development of methods for breeding of young plants and development of new varieties of medicinal cannabis.

Visiting Israel is a great opportunity to detect the latest research and development activities taken place at the agricultural sector.
